## Traffic demarcation barriers

To increase the safety and visibility of your temporary site.

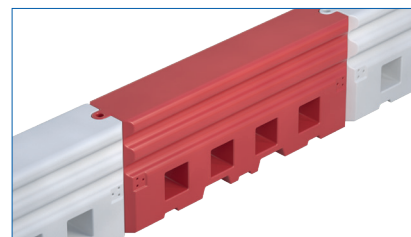

### Heras Interblock 1.75m

When building in a high-traffic zone, you are obliged to install proper traffic management barriers to decrease the chance of accidents occurring. Especially when passengers need to follow designated pathways, our Interblocks can be used. So, with our traffic barriers you guarantee a safe working environment. Available in both red and white, which makes them clearly visible from afar.

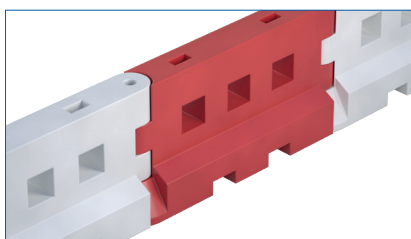

### Heras EVO Barrier 1.0m

The EVO barrier is a fully interlocking barrier system, with which you can create a continuous solid fencing line (using our construction fences). Link several units together to create the most suitable traffic demarcation for your (building) site. In this way, you can protect the public and your employees from accidents occurring and provide a safe environment for everybody. Available in red and white.

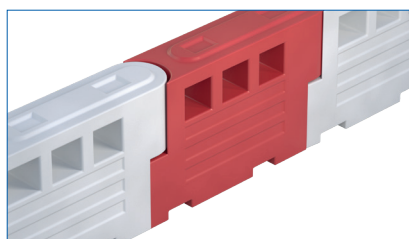

### Heras RB22 Barrier

Our robust RB22 Barriers are ideally suited for deployment in unsafe traffic locations. So, with these barriers you safely board off temporary roadworks and highway maintenance areas. An additional advantage is that if road users do collide with the barrier in an accident, the barrier will absorb the impact energy of the hitting vehicle and reduce the severity of the accident. Available in red and white.

### Heras GB2 Barrier

The GB2 Barrier is a flexible safety barrier as a pin locking device allows the barrier to have a 35 degree configuration allowing for angles and curves. The barrier is very wind resistant and can withstand wind loading of up to 78mph. The GB2 Barrier is thus extremely robust and can be used at various types of temporary sites. Available in red and white to create a highly visible traffic demarcation.

### Heras RB2000 Barrier

Our heavy duty RB2000 Barrier is suitable for low level containment such as highways and protects the public that has to pass your site. The barrier is highly visible because of its safety colours (red and white). This ensures that the RB2000 Barriers are clearly visible from afar. Especially when you link several units together, you will create a very suitable traffic demarcation for your site with our RB2000 Barrier.

### Bull Barrier

The Bull Barrier is a safety system to segregate pedestrians and increase traffic control. They are typically deployed to protect pedestrians, vehicles and workers while roadworks are in progress. The highly visible safety colours (red and white) clearly show where that work is located, thus contributing directly to public safety whilst being very cost-effective.

**Do you need help with choosing the right traffic demarcation barrier? Contact us.**
